

1)

A smartphone is a handheld device combining a mobile phone's features with those of a computer. It includes a touchscreen interface, various connectivity options (like Wi-Fi and Bluetooth), cameras, and internal components such as a CPU, GPU, and multiple sensors. It is for communication, entertainment, and productivity.

Variables:

1. Weight (grams)
2. Screen size (inches)
3. Battery capacity (mAh)
4. CPU speed (GHz)
5. RAM (GB)
6. Storage (GB)
7. Camera resolution (MP)
8. Connectivity types (4G, 5G, Wi-Fi)
9. Number of cameras
10. Number of CPU cores

Research Question:

How do a smartphone's hardware specifications (CPU speed, RAM, battery capacity) affect user satisfaction and performance in different activities like gaming and multimedia use?

2)

The Urban Heat Island (UHI) effect describes how urban areas are warmer than rural ones due to human activity and dense infrastructure. These areas absorb more heat from buildings, roads, and human activities, influencing local climates, energy usage, and health.

Variables:

1. Temperature difference (urban vs. rural, °C)
2. Vegetative cover (%)
3. Population density (people/km²)
4. Industrial facilities count
5. Building height (m)
6. Absorbent surface area (%)
7. Traffic volume (vehicles/day)
8. Energy consumption (kWh)
9. Air quality index (AQI)
10. Heat-related hospital admissions (annually)

Research Question:

How do urban factors like vegetation, building materials, and traffic impact the intensity of the Urban Heat Island effect and its consequences on climate, energy, and health in major cities?
